

ALASKA POLLUTANT DISCHARGE ELIMINATION SYSTEM

INDIVIDUAL PERMIT – **Proposed Final**

**AK0053686 – Furie Operating Alaska, LLC
KLU Julius R. Platform**

ALASKA DEPARTMENT OF ENVIRONMENTAL CONSERVATION

Wastewater Discharge Authorization Program

**555 Cordova Street
Anchorage, AK 99501**

In compliance with the provisions of the Clean Water Act (CWA), 33 U.S.C. §1251 *et seq.*, as amended by the Water Quality Act of 1987, P.L. 100-4, this Permit is issued under provisions of Alaska Statutes (AS) 46.03; the Alaska Administrative Code (AAC) as amended; and other applicable State laws and regulations.

FURIE OPERATING ALASKA, LLC

is authorized to discharge from a mobile offshore drilling unit (MODU) and Julius R Platform within the Kitchen Lights Unit (KLU) Lease Area with the following approximate location:

Location	Latitude	Longitude	Receiving Water
Julius R. Platform	60.936147	-151.15862	Cook Inlet

in accordance with effluent limits, monitoring requirements, and other conditions set forth herein.

This Permit is effective TBD.

This Permit and the authorization to discharge shall expire at midnight on TBD.

The permittee shall reapply for a permit reissuance on or before TBD, 180 days before the expiration of this permit if the permittee intends to continue operations and discharge(s) at the facility beyond the term of this Permit.

The permittee shall post or maintain a copy of this permit to discharge at the facility and make it available to the public, employees, and subcontractors at the facility.

Proposed Final

SCHEDULE OF SUBMISSIONS

The Schedule of Submissions summarizes some of the required submissions and activities the permittee must complete and/or submit to the Alaska Department of Environmental Conservation (DEC) Permitting (P) or Compliance (C) Programs. The permittee is responsible for all submissions and activities specified in the Permit even if they are not summarized in Table 1.

Table 1: Schedule of Submissions

Section	Submittal	Frequency	Due Date	Submit to: ^a
Appendix A and 2.6.6	Discharge Monitoring Report (DMR)	Monthly	On or before the 28 th of the following month ^b	C
1.2	Request for Alternative Mobile Offshore Drilling Unit	As Needed	Prior to Discharging	P
4.1.1	Certification the Quality Assurance Project Plan (QAPP) has been developed and implemented	1/Term	Within 90 days after Permit effective date.	C
4.2.2	Certification of the Initial Best Management Practices (BMP) Plan	1/Term	Within 90 days after Permit effective date.	C
4.2.6	BMP Plan Certification	1/year	January 31 st of each year during the Permit term	C
2.4.3	Noncontact Cooling Water Chemical Inventory	Annual	January 31 st each year following chemical use	C
2.6.1	Chronic Whole Effluent Toxicity (WET) Most Sensitive Invertebrate	1/Term	Based on Initial screening of Invertebrate	P
2.6.1	Substitution for Chronic WET Invertebrate Based on Availability	As needed	Based on Laboratory Availability	P
2.5.3	Written Request for DEC Approval of Methanol Correlation and Reduced Chronic WET Frequency	1/Term	Based on 20 Paired Data Sets with a Correlation of 0.8 or Greater	P
2.5.3	Written Request for DEC Approval for Chemical Substitution for Methanol	As Needed	Based on 10 or More WET Results Showing Reduced Toxicity	P
2.4.4	Notification of Exceedance of Chronic WET Pollution Reduction (PR) BMP Revision Action Levels for Miscellaneous Discharge 009.	1/Event	Within one week of receipt of results exceeding the trigger.	C and P
Appendix A, 1.3	Application for Permit Reissuance	1/Term	180 days prior to Permit Expiration	P
Appendix A, 3.4.1	Oral notification of noncompliance	As Needed	Within 24 hours from the noncompliance event	C
Appendix A, 3.4.1	Written documentation of noncompliance	As Needed	Within 5 days from the noncompliance event	C
Appendix A, 3.5	Other Noncompliance Reporting	As Needed	At the time the permittee submits DMRs	C
a) See Appendix A 1.1 for addresses.				
b) This due date supersedes the date shown in Appendix A - Standard Conditions, Sections 3.2.1 and 3.2.3 on Page A-9.

1.0 PERMIT COVERAGE

1.1 Authorized Discharges

During the effective period of Individual Permit AK0053686 – Furie Operating Alaska, LLC Julius R. Platform (Permit) the permittee is authorized to discharge pollutants from the following discharges within the limitations and subject to conditions set forth herein:

DISCHARGE NUMBER	DISCHARGE DESCRIPTION
002A	Deck Drainage [Julius R. Platform];
002B	Deck Drainage [Mobile Offshore Drilling Unit (MODU)];
003A	Domestic Wastewater [Julius R. Platform];
003B	Domestic Wastewater [MODU];
004B	Graywater [MODU];
008A	Fire Control System Test Water [Julius R. Platform];
009B	Noncontact Cooling Water [MODU];
010B	Uncontaminated Ballast Water [MODU]; and
015A	Produced water [Julius R. Platform].

This Permit authorizes discharge of only those pollutants from facility processes, waste streams, and operations clearly identified in the Permit or permit application process.

1.2 Authorized Facilities

This Permit was developed based on the characterization of wastewater represented by an initial MODU, the Spartan 151. However, this Permit allows discharges from alternative MODUs so long as the discharge characteristics would not represent a material and substantial alteration or addition to the permitted discharges that would require different permit conditions (18 AAC 83.135(b)(1)). The permittee must submit information and a written request for an alternative MODU for Department written approval.

1.3 General Requirements

- 1.3.1 Discharges shall not cause contamination of surface waters and shall not cause or contribute to a violation of the Alaska Water Quality Standards (18 AAC 70), except if excursions are authorized therein.
- 1.3.2 The discharge of maintenance waste such as removed paint and materials associated with surface preparation and coating application is prohibited.
- 1.3.3 Discharges may not alone or in combination with other substances or wastes, make the water unfit or unsafe for the use; cause a film, sheen, or discoloration on the surface of the water or adjoining shorelines; cause leaching of toxic or other deleterious substances; or cause a sludge, solid, or emulsion to be deposited beneath or upon the surface of the water, within the water column, on the bottom, or upon adjoining shorelines.
- 1.3.4 For purposes of reporting on the DMR for a single sample, if a value is less than the method detection limit, the permittee must report “less than [numeric value of method detection limit]” and if a value is less than a minimum level (ML), the permittee must report “less than [numeric value of ML].” This provision is not applicable to reporting total aromatic hydrocarbons (TAH) or total aqueous hydrocarbons (TAqH).

- 1.3.5 For purposes of calculating a monthly average, zero (0) may be assigned for a value less than the method detection limit, and the [numeric value of method detection limit] may be assigned for a value between the method detection limit and the ML. If the average value is less than the method detection limit, the permittee must report “less than [numeric value of method detection limit]” and if the average value is less than the ML, the permittee must report “less than [numeric value of ML].” If a value is equal to or greater than the ML, the permittee must report and use the actual value. The resulting average value must be compared to the limit in assessing compliance. This provision is not applicable to reporting TAH or total aqueous hydrocarbons TAqH.
- 1.3.6 For purposes of reporting on the DMR for a single sample for TAqH where the parameter is a summation of results of individual analytes, estimated (e.g., "J" estimates) are considered as nondetectable. When all individual analytes are nondetectable, or estimates, the permittee must report the categorical summation of the common method detection limits with a "less than [categorical summation of method detection limits]." If any of the analytes are detectable, the permittee must report the summation of only the detected analytes on the DMR without a less than symbol. See Appendix C for Definition of Categorical Sum.
- 1.3.7 For all effluent compliance monitoring outlined in Section 2.0 the permittee must use an analytical test method approved under Code of Federal Regulations (CFR) Title 40 (40 CFR) Part 136 and adopted by reference at 18 AAC 83.010, that can achieve a reporting limit less than the effluent limit. The permittee must use the method with a sufficiently sensitive method detection limit (See Appendix C – Definitions).
- 1.3.8 For any permit condition that requires onsite records be maintained and made available upon request, the permittee may use readily accessible electronic documents in lieu of hardcopy information to comply with these requirements.
- 1.3.9 The permittee must minimize the discharge of surfactants, dispersants, and detergents except as necessary to comply with the safety requirements of the Occupational Health and Safety Administration. This restriction applies to tank cleaning and other operations that do not directly involve the safety of workers.
- 1.3.10 When applying effluent limits to commingled discharges, the more stringent effluent limits apply to the commingled discharge. If a commingled waste stream is not authorized per Section 1.1, then the commingled discharge is not authorized. Monitoring for compliance with technology-based effluent limits must be accomplished prior to commingling.
- 1.3.11 The permittee must report all violations of maximum daily limits (MDLs) per Appendix A, Standard Conditions, Section 3.4 – 24-Hour Reporting. Violations of all other effluent limits, such as average monthly limits (AMLs), are to be reported per Appendix A, Standard Conditions, Section 3.5 – Other Noncompliance Reporting.
- 1.3.12 This Permit does not absolve the permittee from obtaining permits or authorizations from other Federal, State, or local agencies necessary to conduct activities (e.g., Incident Take or Incident Harassment Authorizations).

2.0 EFFLUENT LIMITATIONS AND MONITORING REQUIREMENTS

2.1 Effluent Limits and Monitoring Requirements for Deck Drainage

In addition to meeting the requirements in Section 1.3, the permittee must limit and monitor deck drainage discharges per Table 4 and the subsequent referenced subsections.

**Table 2: Effluent Limits and Monitoring Requirements for Deck Drainage
(Discharge 002A/B)**

Parameter (Units)	Effluent Limitations	Monitoring Requirements	
		Frequency	Type
Total Flow Volume (million gallons per day (mgd)) ^{2.1.1}	Report	Monthly	Estimated
Oil and Grease (Sheen) ^{2.1.2}	No Discharge	Daily	Visual
Chronic WET (TU _c) ^{2.1.4}	Report	1/Term	Grab

2.1.1 Total Flow Volume

The Permit requires flow volumes to be estimated daily, maintained in a log at the facility, and made available to DEC upon request. The total monthly volume must be reported on the DMR.

2.1.2 Oil and Grease (Sheen)

The permittee must ensure that deck drainage contaminated with oil and grease is processed through an oil-water separator (OWS), or other oil removal process, prior to discharge. Daily while discharging, the permittee must observe the receiving water surface during a time when observation of the water surface is possible and record observations in a daily log maintained onsite. If conditions prevent observations, the permittee may use the Static Sheet Test (EPA Method 1617). Static Sheen Test equipment must be maintained onsite.

2.1.3 Contaminated Deck Drainage Separation BMPs

Per Section 4.2.9.1, the permittee must develop BMPs to ensure deck drainage that is contaminated with oil and grease is processed through an oil-water separator, or other similar treatment process, prior to discharge.

2.1.4 Chronic WET Monitoring for BMP Validation

Chronic WET testing is applicable to Outfall 002A only for validation that BMPs required by Section 4.2.9.1 are effective. Samples must be collected downstream of the OWS during periods of significant rainfall or snowmelt. For characterization of deck drainage, the most sensitive invertebrate species is required per Sections 2.6.1 and 2.6.1.2 using a dilution series of 3.13, 6.25, 12.5, 25, and 50% including a control (zero % effluent) and maximum dilution after hypersaline adjustment (approximately 70 %). A chronic WET result less than or equal to 4 TU_c validates the effectiveness of BMPs such that future monitoring will not be required in the next permit reissuance or authorization under a general permit.

2.2 Effluent Limits and Monitoring Requirements for Domestic Wastewater

In addition to meeting the requirements in Section 1.3, the permittee must limit and monitor domestic wastewater discharges per Table 3 and the subsequent referenced subsections.

**Table 3: Effluent Limits and Monitoring Requirements for Domestic Wastewater
Discharge 003A/003B**

Parameter (Units)	Effluent Limits		Monitoring Requirements	
	MDL	AML	Frequency	Sample Type
Flow (gallons per day(gpd))	---	Report	1/month	Estimate or Meter
pH (standard units(su))	$6.5 \leq \text{pH} \leq 8.5$		1/month	Grab or Meter
Total Suspended Solids (TSS) (milligrams per Liter (mg/L))	60	30	1/month	Grab
Five-Day Biochemical Oxygen Demand (BOD ₅) (mg/L)	60	30	1/month	Grab
Total Residual Chlorine (TRC) Minimum (mg/L) ^{2.2.1}	1.0		1/month	Grab
TRC Maximum (mg/L) ^{2.2.2}	1.0		1/month	Grab
Enterococci Bacteria (Colony Forming Units per 100 milliliters (cfu/100 ml))	Report		1/quarter	Grab
Fecal Coliform (FC) Bacteria (Most Probable Number (MPN)/100 ml)	Report		1/quarter	Grab

2.2.1 TRC Minimum

The compliance point for TRC minimum is immediately after chlorination and must be maintained as close as practicable to 1.0 mg/L.

2.2.2 TRC Maximum

The compliance point for TRC maximum is after the dechlorination treatment prior to commingling.

2.2.3 Domestic Wastewater Treatment System BMPs

During the term of the Permit, the permittee must develop and implement specific BMPs that help ensure compliance with permit limits per Section 4.2.9.6.1. The specific BMPs must include standard operation procedures (SOPs), training objectives, maintenance activities, treatment system troubleshooting, or other elements deemed necessary to ensure compliance.

2.3 Effluent Limits and Monitoring Requirements for Graywater

In addition to meeting the requirements in Section 1.3, the permittee must limit and monitor graywater discharges per Table 4.

**Table 4: Effluent Limits and Monitoring Requirements for Graywater
(Discharge 004B)**

Parameter (Units)	Effluent Limits	Monitoring Requirements	
		Frequency	Type
Total Monthly Volume (million gallons (mg)) ^{2.3.1}	Report	Monthly	Estimate or Measured
Oil and Grease (visible sheen) ^{2.3.2}	No Discharge	Daily	Observation
TRC (mg/L) ^{2.3.3}	Maximum 1.0	Monthly	Measure

2.3.1 Total Monthly Volume

The Permit requires effluent flow volume to be to measured or estimated for each month a discharge occurs with the total monthly volume reported on the DMR.

2.3.2 Oil and Grease (Visible Sheen)

The Permit prohibits the discharge of oil and grease as determined by a visible sheen on the receiving water surface. Receiving water observations must be conducted once per day during daylight at the time of maximum estimated discharge (e.g., following morning or midday meals). Observations must be recorded in daily operating logs and made available upon request by DEC. To support this narrative limit, the permittee must develop specific housekeeping BMPs to minimize introduction of oil and grease and foam causing agents at the source per Section 4.2.9.2.

2.3.3 Total Residual Chlorine Maximum

For MODUs that use a marine sanitation device (MSD) to treat graywater to greater than primary treatment (e.g., Spartan 151), the Permit establishes a maximum limit on the concentration of TRC of 1.0 mg/L after dechlorination and prior to discharge. The permittee must develop specific BMPs to ensure proper operation and maintenance of the chlorination and dechlorination systems per Section 4.2.9.6.2. If the MODU uses a treatment system other than an MSD to provide primary treatment, the 1.0 mg/L maximum TRC limit and specific BMPs do not apply.

2.4 Effluent Limits and Monitoring Requirements for Miscellaneous Discharges

In addition to the requirements in Section 1.3, the permittee must limit and monitor miscellaneous discharges as specified in Table 5 and the subsequent referenced subsections.

**Table 5: Effluent Limits and Monitoring Requirements for Miscellaneous Discharges
(Discharge 008A; Discharge 009B; and Discharge 010B)**

Parameter	Effluent Limitations	Monitoring Requirements	
		Frequency	Type
Maximum Daily Flow (mgd) ^{2.4.1}	Report	Monthly	Estimate
Oil and Grease (visual sheen) ^{2.4.2}	No Discharge	Daily	Visual
Chemical Inventory ^{2.4.3}	Report	Once/Year	Inventory
Chronic WET ^{2.4.4, 2.4.5 and 2.6}	Report	Once/Year	Grab

2.4.1 Maximum Daily Flow

The Permit requires the maximum daily effluent flow for a given month to be measured, or estimated, and reported in mgd on the DMR. If chemicals have been added to the discharge, the daily flow measurement must be conducted over a 24-hour period and recorded in a log and made available to DEC upon request. If chemicals are used and the 24-hour flow volume is greater than 10,000 gpd, the permittee must collect grab samples that are representative of the chemically treated effluent and conduct a chronic WET testing per Section 2.6 and chemical inventory per Section 2.4.3.

2.4.2 Oil and Grease (Visible Sheen)

The prohibition of oil and grease visible sheen applies to all miscellaneous discharges:

- Discharges 008A – Fire Control Test Water;
- Discharge 009B – Noncontact Cooling Water; and
- Discharge 010B – Uncontaminated Ballast Water.

The permittee must observe for a visible sheen on the water surface during slack tide while discharging or by Static Sheen Test at the permittee's discretion. If the ballast water from the MODU (Discharge 010B) to be discharged has visible sheen, the discharge must be treated using an OWS, or equivalent treatment process (See Specific BMP in Section 4.2.9.3).

2.4.3 Chemical Inventory

The permittee is allowed to use chemical additives in Noncontact Cooling Water (Discharge 009B) but in a manner that does not exceed the most stringent of the following four constraints:

- The maximum concentrations and any other conditions specified in the Environmental Protection Agency (EPA) product registration labeling if the chemical is an EPA registered chemical;
- The maximum manufacturer's recommended concentration;
- 500 mg/L; or
- The estimated chronic toxicity based on the mixed concentration of the chemical(s) in the waste stream may not be greater than 189 chronic toxicity units (TU_c) based on the most limiting 25 percent (%) effect concentration listed from the aquatic toxicological information obtained in material data sheet (MDS) for the chemical,

if available. Note that when only acute toxicity data is provided on an MDS, the permittee must use a reported acute to chronic ratio (ACR) for that chemical and species, or a default ACR of 10, to estimate the TU_c of the mixture.

The permittee must maintain a precise chemical inventory of all constituents added, including the time, dose, and frequency of each chemical additive used in miscellaneous discharges. The permittee must submit these inventory records to DEC annually with BMP certifications required in Section 4.2.6.2 even if no chemicals have been used.

2.4.4 Specific Pollution Reduction BMPs and BMP Revision Action Levels

For Noncontact Cooling Water (Discharge 009B) with chemical additives and a discharge greater than 10,000 gpd, the permittee must implement a chemical dosing BMP to optimize the use of chemicals and to minimize the potential for chronic toxicity per Section 4.2.9.4. In addition, the permittee must make revisions to existing BMPs should any single chronic WET result exceed the Pollution Reduction (PR) BMP Revision Action Level of 189 TU_c .

If a PR BMP Revision Action Level is exceeded, the permittee must revise the BMP to achieve less toxicity in the subsequent WET test. These BMPs could be operational or physical modifications to the chemical dosing system. The permittee must notify DEC in writing within one week of obtaining chronic WET results that exceed the chronic WET PR BMP Revision Action Level of 189 and submit a letter within 60 days specifying what BMP revisions will be implemented prior to the next scheduled chronic WET monitoring event. If BMPs require modification to the physical system, updated line diagrams must be developed and submitted to DEC as an attachment to the letter. Note, DEC may require additional monitoring per Section 2.6.5.1. The revised BMP must be implemented to satisfy compliance with this specific BMP requirement for pollution reduction. Revisions must continue until the PR BMP Plan Action Level is achieved. If the discharge of chemicals is eliminated, no PR BMPs are required. If chemicals are used but the discharge is reduced below 10,000 gpd, chronic WET testing is not required and the permittee must follow the chemical dosing limitations of Section 2.4.3.

2.4.5 Specific Chronic WET Requirements for Chemically Treated Noncontact Cooling Water

Chronic WET monitoring applies Noncontact Cooling Water (Discharge 009B) if chemical additives are used and greater than 0.010 mgd (10,000 gpd) is discharged over a 24 hour period, including discharges that may be commingled and discharged accumulatively.

2.4.5.1 Test Species

For discharges that have chemical additives and discharge 0.01 mgd (10,000 gpd) or more in a 24 hour period, the permittee is required to conduct chronic WET monitoring on one invertebrate species listed in Section 2.6.1.2.

2.4.5.2 Dilution Series

The dilution series for chronic WET monitoring of chemically treated Noncontact Cooling water must bracket the PR BMP Reduction Action Level represented by the trigger of 189 TU_c . Hence, the dilution series is 0.125, 0.25, 0.5, 1.0, and 2.0 including a control (zero % effluent).

2.4.5.3 Monitoring Frequency:

When WET monitoring is required based on the condition of chemical use and daily flow volume, the permittee must conduct chronic WET monitoring annually. Note that this frequency does not include possible accelerated testing per Section 2.6.5.1.

2.4.5.4 Sample Collection

The permittee must evaluate chemical dosing practices versus sample collection methods and timing in order to ensure the collected sample is representative of the toxicity of the dosing. For example, for continuous discharges with continuous chemical injection rates a grab or composite sample could result in collection of a representative sample. However, if the discharge is intermittent and/or chemical dosing is discontinuous, the permittee must evaluate the timing and duration of peak concentrations in the effluent to properly time sample events to obtain a representative sample. Each facility must have a QAPP that specifies this procedure (See Section 4.1) and the subsequent referenced subsection.

2.5 Effluent Limits and Monitoring Requirements for Produced Water

In addition to the requirements in Section 1.3, the permittee must limit and monitor miscellaneous discharges as specified in Table 6 and subsequent referenced subsections.

Table 6: Effluent Limits and Monitoring Requirements for Produced Water (Discharge 015)

Parameter (Units)	Effluent Limitations		Monitoring Requirements	
	MDL	AML	Frequency	Sample Type
Flow Rate (mgd)	Report	0.21	1/Week	Estimate or Measure
pH (su)	6.0 < pH < 9.0		1/Week	Grab
Oil and Grease (Visible Sheen) ^{2.5.1}	No Discharge		1/Week	Observation
Oil and Grease (mg/L)	42	29	1/Week	Grab
Total Recoverable Copper (µg/L)	16.7	8.3	1/Month	Grab
Chronic WET (TU _C) ^{2.5.2, 2.5.3 and 2.6}	410	---	1/Month	Grab
Methanol (mg/L) ^{2.5.3}	Report		1/Month	Grab
TAH (µg/L)	Report		1/Quarter	Grab
TAqH (µg/L)	Report		1/Quarter	Grab
Selenium (µg/L)	Report		1/Quarter	Grab
Nickel (µg/L)	Report		1/Quarter	Grab
Manganese (µg/L)	Report		1/Quarter	Grab
Mercury (µg/L)	Report		1/Quarter	Grab

2.5.1 Visual Sheen and Supplemental Oil and Grease Monitoring

While discharging from platforms, the permittee shall monitor for oil and grease using visual observations of the receiving water surface in the vicinity of the discharge during periods of the day when observation of a sheen on the water surface is possible. If conditions prevent observations, the permittee may use the Static Sheet Test (EPA Method 1617). Static Sheen Test equipment must be maintained onsite. Observations must be maintained in a log at the facility and reported on the DMR. Upon observation of a sheen, a supplemental oil and grease sample must be collected and analyzed by a

laboratory for verification the numeric limit has not been exceeded. This requirement does not apply to shore based facilities or unmanned platforms.

2.5.2 Specific Chronic WET Monitoring of Produced Water for Permit Compliance

There are two purposes for conducting chronic WET monitoring under the Permit, compliance with the limit in Table 12 and chronic toxicity characterization and correlation to methanol per Section 2.5.3. To comply with chronic WET limits, the permittee is required to conduct chronic WET monitoring for both a vertebrate and invertebrate species discussed in Sections 2.6.1.1 and 2.6.1.2, respectively.

The compliance dilution series is based on a pass/fail approach and, accordingly, must bracket the critical dilution associated with the limit, two dilutions above and below the critical dilution of 0.25. The compliance dilution series is 0.0625, 0.125, **0.25**, 0.5, 1.0 including a control (zero % effluent). Should any chronic WET result exceed the limit in Table 6, the permittee must notify DEC within 24 hours per Appendix A - Standard Conditions Section 3.4.1 and research the high toxicity event. The permittee must provide written notification to DEC within one week to provide information on the circumstances of the high toxicity event and provide an assessment as to what may have caused the exceedance of the chronic WET limit. The permittee must repeat the chronic WET monitoring within 30 days of notifying DEC and submit a follow up written notification of the subsequent results. Based on these results, DEC may require additional monitoring per Section 2.6.5.1.

2.5.3 Specific Chronic WET Monitoring of Produced Water for Characterization/Correlation

Currently, there is no facility-specific data that compares methanol concentrations to chronic toxicity. Based on initial characterization discussed in Fact Sheet Section 2.2, ongoing characterization is necessary to develop a correlation with methanol concentrations with the intent of using methanol as a surrogate for compliance with chronic toxicity. If a result for chronic WET required for compliance with the MDL exceeds 250 TUC, the permittee must inform DEC within one week of receiving the results and present a schedule for completing a minimum of 10 chronic WET tests for characterization that meets DEC approval. In addition, chronic toxicity characterization is necessary to support the next application for reissuance. Lastly, if the permittee seeks to substitute another chemical for methanol, it too would need to be characterized to demonstrate the substitute has less toxicity than methanol to support DEC approval for use under the Permit.

The characterization dilution series is different than the pass/fail dilution series used for compliance; the toxicity is anticipated to be observed in much higher dilutions and is likely variable and correlated to the concentration of methanol. The investigative objectives for characterizing and correlating methanol to toxicity requires flexibility in applying dilution series so that it brackets “actual effluent toxicity.” Therefore, the initial dilution series of 0.75, 1.5, 3, 6, 12, 24 including a control (zero % effluent) and maximum dilution after hypersaline adjustment (approximately 70 %) is proposed and can be adjusted based on previous results to help ensure useful data is collected. DEC encourages coordination on dilution series adjustments but pre-approval is not required. For characterization and correlation of produced water, the most sensitive invertebrate species is required per Sections 2.6.1 and 2.6.1.2; testing of vertebrate species is not required for produced water characterization or correlation. It is incumbent upon the

permittee and the contract laboratory to ensure appropriateness of the data collected by developing BMP procedures per Section 4.2.9.5 and supported by a QAPP per Section 4.1. Note that the QAPP for methanol characterization procedures may be included in the BMP Plan so long as it is appropriately labeled as a QAPP section of the Plan.

Methanol monitoring for characterization must be conducted monthly with the chronic WET results to determine if a correlation may be effective for monitoring that the effluent does not exceed the chronic WET limit of 410 TU_c using methanol as a surrogate for chronic WET. A reasonable demonstration of a correlation will be based on a minimum of 10 paired data sets (i.e., the chronic WET result representing the most sensitive species and the methanol concentration) and a correlation coefficient greater than 0.7. A reasonable data set to approve a substitution is based on a minimum of 10 WET results indicating the toxicity is less than that for methanol. Based on presenting a reasonable demonstration that a correlation between chronic toxicity and methanol concentrations exists for the effluent, or other approved chemical substitutions for methanol are less toxic in two consecutive samples, the permittee may submit a written request to DEC for a frequency reduction to quarterly on compliance monitoring of chronic WET for produced water. If approved by DEC in writing, the quarterly chronic WET monitoring will use a dilution series for characterization in this section, rather than pass/fail dilution series described in Section 2.5.2. The written approval may include other reporting requirements associated with using methanol, or other chemicals, as a surrogate for chronic toxicity.

2.5.4 Produced Water Treatment System SOPs

To properly operate and maintain the produced water system in compliance with the Permit, the permittee must develop specific BMPs per Section 4.2.9.6.3 for the separation unit and two-stage filtration system, including the flotation add-on to the separation unit if applicable.

2.6 Chronic WET Monitoring Requirements

The permittee must conduct chronic WET testing per this section while applying discharge-specified requirements for noncontact cooling water discharges in Section 2.4.5 that supersedes requirements in this section for test species, dilution series, sampling frequencies, and sample collection. See also Section 2.5.3 for specific chronic WET monitoring of produced water for methanol characterization and correlation studies and for chemical substitutions for methanol.

2.6.1 Test Species and Methods

When chronic WET monitoring is required by the Permit, the permittee must conduct chronic WET testing on one vertebrate and one invertebrate species unless otherwise stated in discharge specific sections of the Permit (See Section 2.4.5). The permittee must conduct the WET testing to screen for the most sensitive invertebrate species in Section 2.6.1.2 once per permit term for each discharge (i.e., noncontract cooling water and produced water). For produced water, the appropriate dilution series for screening the most sensitive species is that for characterization per Section 2.5.3. The elimination of the less sensitive species over more sensitive invertebrate species must be approved by DEC in writing for use in subsequent chronic WET tests. Upon identification of the most sensitive test species, the permittee may submit a written request to eliminate the less sensitive species in subsequent

WET analysis for DEC approval. DEC can also approve written requests to substitute the less sensitive species during periods when the more sensitive species is unavailable. The permittee shall not make any changes to the selection of test species without prior written DEC approval.

2.6.1.1 Vertebrate (survival and growth)

Atherinops affinis (topsmelt). In the event that topsmelt is not available, *Menidia beryllina* (inland silverside) may be used as a substitute. The permittee shall document the use of substitute species in the DMR for the testing.

2.6.1.2 Invertebrate

For larval development tests, the permittee must use bivalve species *Crassostrea gigas* (Pacific Oyster) or *Mytilus spp.* (mussel) and *Americamysis bahia* (formerly *Mysidopsis bahia*, mysid shrimp) for survival and growth. Due to seasonal variability, testing may be performed during reliable spawning periods (e.g., December through February for mussels and June through August for oysters).

2.6.2 **Monitoring Frequency**

See discharge-specific sections for frequency requirements, Sections 2.5.2 and 2.5.3 for produced water and Section 2.4.5.3 for chemically treated noncontact cooling water.

2.6.3 **Procedures**

The permittee must conduct chronic WET testing using the following procedures.

2.6.3.1 Methods and Endpoints

For the shrimp and alternate fish species, inland silverside, the presence of chronic toxicity must be estimated as specified in *EPA Short-Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms, Third Edition* (EPA 821 R 02 014). For the bivalve species and topsmelt, chronic toxicity must be estimated as specified in *Short-Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Water to West Coast Marine and Estuarine Organisms* (EPA/600/R 95/136). The WET testing will determine the 25 % effect concentration (EC₂₅) endpoint estimate of the effluent concentration that would cause a 25 % reduction in normal embryo development for the bivalves or in survival for fish and/or mysid shrimp. The WET testing will also determine the 25 % inhibition concentration (IC₂₅) point estimate of the effluent concentration that would cause a 25 % reduction in the growth of the fish and/or mysid shrimp.

2.6.3.2 Reporting Results

Results must be reported on the DMR using TU_c , where $TU_c = 100/EC_{25}$ or $100/IC_{25}$. The reported EC₂₅ or IC₂₅ must be the lowest point estimate calculated for the applicable survival, growth or normal embryo development endpoints. The permittee must report the no observed effect concentrations (NOECs) in the full WET test report. DEC may compare this information with the IC₂₅ during reissuance of the Permit.

2.6.3.3 Acute Toxicity Estimates

Although acute WET testing is not required, the permittee must provide an

estimate of acute toxicity based on observations of mortality when appropriate (e.g., survival endpoints). Acute toxicity estimates, if available, must be documented in the full report.

2.6.3.4 Dilution Series

A series of at least five dilutions and a control must be tested. See Section 2.4.5.2 for dilution series for chemically treated noncontact cooling water. For compliance monitoring of produced water see Section 2.5.2 and Section 2.5.3 for characterization and correlation of produced water. Depending on objectives for characterization, DEC may provide written direction to modify the previous dilution series based on review of previous test results.

2.6.3.5 Hold Times

WET sample holding times are established at 36 hours but longer hold times up to 72 hours may be approved by DEC. The permittee must document the conditions that resulted in the need for the holding time to exceed 36 hours and the potential effect on the test results.

2.6.3.6 Additional Quality Assurance Procedures

In addition to those quality assurance measures specified in the methodology, the following quality assurance procedures must be followed:

- a) If organisms are not cultured by the testing laboratory, concurrent testing with reference toxicants must be conducted, unless the test organism supplier provides control chart data from at least the previous five months of reference toxicant testing. Where organisms are cultured by the testing laboratory, monthly reference toxicant testing is sufficient.
- b) If either of the reference toxicant tests or the effluent tests does not meet all test acceptability criteria as specified in the test methods manual, then the permittee shall re-sample and re-test within the following month.
- c) Control and dilution water must be receiving water, or salinity adjusted lab water. If the dilution water used is different from the culture water, a second control, using culture water must also be used.

2.6.3.7 Adherence to Test Procedures

It is unlawful and a violation of this permit for a permittee or their designated agent, to manipulate test samples in any manner or to purposefully delay sample shipments. The permittee must notify DEC when sample shipments must be delayed for just cause. Once initiated, all WET tests must be completed per the applicable method unless specific authority has been granted by DEC and EPA Region 10 Alternative Test Procedure Coordinator.

2.6.4 WET Reporting

2.6.4.1 DMRs and Full Report Deliverables

The permittee shall submit chronic WET test results on next month's DMR following the month of sample collection. The permittee must also submit the full WET Report as an attachment to the DMR per Section 2.6.6.

2.6.4.2 Full Report Preparation

The report of results shall include all relevant information outlined in Section 10 of Report Preparation in the *EPA Short-Term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Marine and Estuarine Organisms, Third Edition* (EPA 821 R 02 014).

2.6.4.3 Additional Reporting Information

In addition to toxicity test results, the permittee shall report:

- a) The date and time of sample collection and initiation of each test,
- b) The discharge flow rate at the time of sample collection, and
- c) A list of corrosion inhibitors, biocides, algaecides, clarifying agents, or other additives being used by facility that could potentially be in the effluent during the 30 day period preceding sampling, and
- d) All raw data and statistical analysis from the tests, including reference toxicant tests.

2.6.5 Additional Effluent Monitoring

2.6.5.1 Additional Monitoring per DEC Request

DEC may require additional monitoring of effluent or receiving water for facility or site-specific purposes, including, but not limited to: data to support applications, demonstration of water quality protection, obtaining data to evaluate ambient water quality, evaluating causes of elevated concentrations of parameters in the effluent, and conducting chronic WET monitoring or toxicity identification and reduction evaluations. If additional monitoring is required, DEC will provide the permittee or applicant the request in writing.

2.6.5.2 Additional Monitoring at Permittee Discretion

The permittee also has the option of taking more frequent samples than required under the Permit. These additional samples must be used for averaging if they are conducted using the Department approved test methods (generally found in 18 AAC 70 and 40 CFR 136 [adopted by reference in 18 AAC 83.010]). The results of any additional monitoring must be included in the calculation and reporting of the averaged data on DMRs as required by the Permit and Standard Conditions Part 3.2 and 3.3 (Permit Appendix A).

2.6.5.3 Sufficiently Sensitive Methods

Monitoring for effluent limitations must use methods with method detection limits that are less than the effluent limitations or are sufficiently sensitive. Monitoring effluent or receiving water for the purpose of comparing to water quality criteria must use 40 CFR 136 approved methods that are less than the applicable water quality criteria or are sufficiently sensitive per 40 CFR 122.21(a)(3). See Sufficiently Sensitive in Appendix C – Definitions.

2.6.6 Discharge Monitoring Reports

2.6.6.1 Monitoring required in Section 2.0 shall be summarized each month in NetDMR per Section 2.6.7.1.

- 2.6.6.2 This Permit requires the permittee to submit DMRs required in Section 2.6.6.1 even for months when discharges do not occur. The Permittee must submit a DMR indicating no discharge has occurred.
- 2.6.6.3 The DMR must be submitted to DEC by the 28th day of the following calendar month per Section 2.6.6.3.
- 2.6.6.4 The permittee must sign and certify all DMRs, reports, and other submittals in accordance with signatory requirements in Section 1.12 of Appendix A - Standard Conditions.
- 2.6.7 Electronic Reporting
- 2.6.7.1 E-Reporting Rule, Phase I (DMRs).
- The permittee must submit a DMR for each month by the 28th day of the following month. DMRs shall be submitted electronically through NetDMR per Phase I of the E-Reporting Rule (40 CFR 127). Authorized persons may access permit information by logging into the NetDMR Portal (<http://cdxnodengn.epa.gov/oeca-netdmr-web/action/login>). DMRs submitted in compliance with the E-Reporting Rule are not required to be submitted as described in Permit Appendix A – Standard Conditions unless requested or approved by the Department. Any DMR data required by the Permit that cannot be reported in a NetDMR field (e.g. full WET reports, mixing zone receiving water data, etc.), shall be included as an attachment to the NetDMR submittal. DEC has established an e-Reporting Information website (<https://dec.alaska.gov/water/compliance/electronic-reporting-rule>) that contains general information about this new reporting format. Training materials and webinars for NetDMR can be found at <https://netdmr.zendesk.com/home>.
- 2.6.7.2 E-Reporting Rule - Phase II (Other Reports).
- Phase II of the e-Reporting Rule specifies that permittees will integrate electronic reporting for all other reports required by the Permit (e.g., Annual Reports and Certifications) and implementation is expected to begin during the term of the Permit. Permittees should monitor the DEC e-Reporting website (<https://dec.alaska.gov/water/compliance/electronic-reporting-rule>) for updates on Phase II of the E-Reporting Rule and will be notified when they must begin submitting all other reports electronically. Until such time, other reports required by the Permit may be submitted in accordance with Permit Appendix A – Standard Conditions.

3.0 Mixing Zones

The Department authorizes the following mixing zones for this Permit:

3.1 Platform/MODU Domestic Wastewater (003A and 003B or 004B Combined)

The outfalls for domestic wastewater from the platform and MODU are combined for a single mixing zone. The discharge of graywater from the MODU (Discharge 004B) can be substituted for the domestic wastewater (Discharge 003B) given each is limited to 1.0 mg/L TRC, DEC authorizes an acute and chronic mixing zone for total residual chlorine. The acute mixing zone is a 17-meter radii cylindrically shaped mixing zone extending from the

sea surface to the seafloor with an authorized dilution factor of 77. The chronic mixing zone is a 35-meter radii cylindrically shaped mixing zone extending from the sea surface to the seafloor with an authorized dilution factor of 133.

3.2 MODU Graywater Discharged Overboard (Discharge 004B Individually)

For graywater discharged from the MODU overboard and above the water surface, DEC authorizes a 2-meter radii cylindrically shaped acute mixing zone and a 5-meter radii cylindrically shaped chronic mixing zone both extending from the sea surface to the seafloor. The authorized dilution factors are 133 chronic and 77 acute.

3.3 Miscellaneous Discharges (Discharge 009B)

DEC authorizes a standardized 100-meter radii, cylindrically shaped chronic mixing zone for chronic WET and temperature extending from the sea surface to the seafloor with an authorized chronic dilution factor of 189 for noncontact cooling water.

3.4 Produced Water (Discharge 015)

DEC authorizes a rectangular shaped chronic mixing zone for chronic WET, copper, silver, and selenium that is 220-meters long (110 meters in each prevailing current direction) by 48-meters wide extending from the sea surface to the seafloor. In addition, DEC authorizes a 0.4-meter radii acute mixing zone for copper that extends from the sea surface to the seafloor. The authorized chronic dilution is 250 and the acute is 3.25.

4.0 SPECIAL CONDITIONS

4.1 Quality Assurance Project Plan

- 4.1.1 The permittee must develop a facility-specific QAPP for all monitoring required by this Permit. The permittee must submit written notice to DEC affirming that the QAPP is up to date and is being implemented within 90 days of the effective date of this Permit. Any existing QAPP may be modified under this Section.
- 4.1.2 All procedures in the previous QAPP must be followed until the new QAPP has been implemented.
- 4.1.3 The QAPP must be designed to assist in planning for the collection and analysis of effluent and other water samples in support of the Permit and to help explain data anomalies whenever they occur.
- 4.1.4 At the discretion of the permittee, QAPP content specific to characterization and correlation of methanol, or substitution of methanol in produced water, per Section 4.2.9.5 may be included in the BMP Plan so long as the subsection is titled "QAPP."
- 4.1.5 The permittee may use the generic DEC Wastewater Treatment Facility Quality Assurance Project Plan (DEC QAPP) as a template to develop a facility-specific QAPP required per Section 4.1.1. If using the generic DEC template, the developed QAPP must be specific for the facility.
- 4.1.6 Throughout all sample collection and analysis activities, the permittee must use DEC-approved quality assurance and quality control (QA/QC) and chain-of-custody procedures, as described in the *Requirements for Quality Assurance Project Plans*

(EPA/QA/R-5) and *Guidance for Quality Assurance Project Plans* (EPA/QA/G-5). The QAPP must be prepared in the format specified in these documents.

4.1.7 At a minimum, a QAPP must include:

4.1.7.1 Details on number of samples, type of sample containers, preservation of samples, holding times, analytical methods, analytical detection and quantitation limits for each target compound, type and number of quality assurance field samples, precision and accuracy requirements, sample preparation requirements, sample shipping methods, and laboratory data delivery requirements;

4.1.7.2 Maps indicating the location of each sampling point;

4.1.7.3 Qualification and training of personnel; and

4.1.7.4 Name, address, and telephone number of all laboratories used by or proposed to be used by the permittee.

4.1.8 The permittee must amend the QAPP whenever sample collection, sample analysis, or other procedure addressed by the QAPP is modified.

4.1.9 Copies of the QAPP must be kept on site and made available to DEC upon request.

4.2 Best Management Practices Plan

4.2.1 Purpose

Through implementation of the BMP Plan the permittee must prevent or minimize the generation and the potential for release of pollutants from the facility to the waters of the U.S. through normal and ancillary activities.

4.2.2 Development and Implementation Schedule

The permittee must develop and implement a BMP Plan which achieves the objectives and the specific requirements listed below. The permittee must submit written notice to DEC that the Plan has been developed and implemented within 90 days of the effective date of the Permit. An existing BMP Plan may be modified for compliance with this Section.

4.2.3 Objectives

The permittee must develop and amend the BMP Plan consistent with the following objectives for the control of pollutants.

4.2.3.1 The number and quantity of pollutants and the toxicity of effluent generated, discharged, or potentially discharged at the facility must be minimized by the permittee to the extent feasible by managing each waste stream in the most appropriate manner.

4.2.3.2 Under the BMP Plan and especially within any standard operating procedures in the BMP Plan, the permittee must ensure proper operation and maintenance of water management and wastewater treatment systems. BMP Plan elements must be developed in accordance with good engineering practices.

- 4.2.3.3 Each facility component or system must be examined for its waste minimization opportunities and its potential for causing a release of significant amounts of pollutants to waters of the U.S. due to equipment failure, improper operation, natural phenomena such as rain or snowfall, etc. The examination must include all normal operations and ancillary activities including material storage areas, storm water, in-plant transfer, material handling and process handling areas, loading or unloading operations, spillage or leaks, sludge and waste disposal, or drainage from raw material storage.
- 4.2.4 Elements of the BMP Plan. The BMP Plan must be consistent with the objectives above and the general guidance contained in *Guidance Manual for Developing Best Management Practices* (EPA 833-B-93-004, October 1993), *Storm Water Management for Industrial Activities, Developing Pollution Prevention Plans and Best Management Practices* (EPA 832-R-92-006) or any subsequent revision to these guidance documents.
- 4.2.5 Plan Components
 - The BMP Plan must include, at a minimum, the following items:
 - 4.2.5.1 Statement of BMP Policy. The BMP Plan must include a statement of management commitment to provide the necessary financial, staff, equipment, and training resources to develop and implement the BMP Plan on a continuing basis.
 - 4.2.5.2 The BMP Plan must establish a BMP Committee responsible for developing, implementing, and maintaining the BMP Plan. Specify the structure, functions, and procedures of the BMP Committee.
 - 4.2.5.3 Description of potential pollutant sources.
 - 4.2.5.4 Risk identification and assessment.
 - 4.2.5.5 Standard operating procedures to achieve the above objectives and specific best management practices (See Below).
 - 4.2.5.5.1 Reporting of BMP incidents. The reports must include a description of the circumstances leading to the incident, corrective actions taken and recommended changes to operating and maintenance practices to prevent recurrence.
 - 4.2.5.5.2 Materials compatibility.
 - 4.2.5.5.3 Good housekeeping.
 - 4.2.5.5.4 Inspections.
 - 4.2.5.5.5 Preventative maintenance and repair.
 - 4.2.5.5.6 Security.
 - 4.2.5.5.7 Employee training on the BMP Plan.
 - 4.2.5.5.8 Record keeping and reporting.
 - 4.2.5.5.9 Prior evaluation of any planned modifications to the facility to ensure that the requirements of the BMP plan are considered as part of the modifications.
 - 4.2.5.5.10 Final constructed site plans, drawings, and maps (including detailed storm water outfall/culvert configurations).

4.2.6 Review and Recertification

The BMP Plan must be reviewed and recertified as follows:

- 4.2.6.1 Annual review by the MODU operator and BMP Committee.
- 4.2.6.2 Certified statement the above reviews were completed and the BMP Plan fulfills the requirements set forth in this Permit. The statement must be certified by the dated signatures of each BMP Committee member. The statement must be submitted to DEC on or before January 31st of each year of operation under this Permit after the initial BMP Plan submittal (Section 4.2.2).

4.2.7 Documentation.

The permittee must maintain a copy of the BMP Plan at the facility and make it available to DEC or an authorized representative upon request. Electronic copies are appropriate so long as they are available during inspections.

4.2.8 BMP Plan Modification

- 4.2.8.1 The permittee must amend the BMP Plan whenever a change in the facility or in the operation of the facility materially increases the generation of pollutants or their release or potential release to receiving waters.
- 4.2.8.2 The permittee must amend the BMP Plan whenever the plan is found to be ineffective in achieving the general objective of preventing and minimizing the generation and the potential for the release of pollutants from the facility to waters of the U.S. Any changes to the BMP Plan must be consistent with the objectives and specific requirements listed above.

4.2.9 Specific BMPs. The BMP Plan must establish BMPs or other measures to achieve the objectives under Section 4.2.3, which ensure that the following specific requirements are met:

4.2.9.1 BMPs for Deck Drainage

Per Section 2.1.3, the permittee must develop BMPs to ensure deck drainage that is contaminated with oil and grease and other pollutants is processed through an oil-water separator, or other similar treatment process, prior to discharge. BMPs must also include mitigating contact between precipitation, or snowmelt water, and sources of pollution stored on deck using appropriate housekeeping and other BMP activities discussed in Section 4.2.5.

4.2.9.2 Housekeeping BMPs for Graywater

Per Section 2.3.2, permittees shall develop and implement housekeeping BMPs which ensure discharges do not contain oil (e.g., cook oils), floating solids, foam or garbage and have minimal chemical cleaning compounds and disinfection products (e.g., chlorine) through adherence with manufacturer's instructions. In addition, for discharges of graywater treated using an MSD, or other system adding chlorine, the permittee must develop and implement operation and maintenance BMPs that ensure consistent and effective dechlorination to achieve appropriate chlorine levels (e.g., less than 1.0 mg/L).

4.2.9.3 BMPs for Ballast Water Potentially Oil-Contaminated with Oil

Per Section 2.4.2, specific BMPs must be developed and implement to support the

prohibition of free oil for the discharge of uncontaminated ballast water (010). Contaminated ballast water must be treated using an oil-water separator or other procedure to remove oil and grease sheen.

4.2.9.4 BMPs for Noncontact Cooling Water

Per Section 2.4.4, DEC requires that the BMP Plan include a specific BMP to optimize the use of chemicals (e.g., a chemical-dosing matrix) and to minimize the potential for chronic toxicity in discharges of noncontact cooling water (Discharge 009) that is required to monitor for chronic WET. Upon exceeding the chronic WET PR BMP Revision Action Level of 189 TU_c, the permittee must modify this specific BMP to reduce subsequent chronic toxicity to below the PR BMP Revision Action Levels. Examples of BMP revisions include, but are not limited to, revamping the chemical dosing matrix or injection practices; substitution of less toxic chemicals; eliminating, reducing, or controlling spikes resulting from batch dosing; or alternative disposal options. BMPs must continue to be revised until the chronic WET PR BMP Revision Action Levels are attained. A failure to revise the BMP constitutes noncompliance with this section.

4.2.9.5 Methanol Correlation or Replacement in Produced Water

As discussed in Sections 2.5.3, the chronic toxicity of the produced water is anticipated to correlate with methanol given the low concentration of other pollutants. In addition, there may be other chemical additives effective in mitigating hydrate formation that imparts less chronic toxicity. A reduction in toxicity, or a correlation of toxicity to methanol, can be used by the permittee to justify less frequent chronic WET monitoring for compliance per Section 2.5.3. Given the chronic WET results obtained to date have yet to be based on observed endpoints in the dilution series tested, the permittee must develop a specific BMP Plan for conducting ongoing chronic WET monitoring for the purpose of evaluating a correlation with methanol or demonstrating a substitute for methanol imparts less toxicity than methanol. If the permittee chooses not to seek a correlation to methanol, substitution of another chemical, or a frequency reduction then this requirement is not applicable.

For correlative investigations, Section 2.5.3 provides objectives, initial dilution series, and target benchmarks for establishing an appropriate correlation (at least 10 detectable results and a correlation coefficient 0.7 or greater) for methanol to use for the purpose of frequency reduction on chronic WET monitoring for compliance. If the permittee seeks frequency reduction through correlation, a specific characterization BMP Plan must be developed and submitted to DEC for review and comment that adequately addresses the objectives and requirements of Section 2.5.3.

For demonstration of an acceptable substitution for methanol, at least one year of chronic WET data consisting of 10 results with observed endpoints must be available to compare to the chronic toxicity of a substitute. The number of discrete data points for the substitute needed to demonstrate it is less toxic will be based on a direct comparison of toxicity data for methanol with the proposed substitute. The permittee may request a substitution and a frequency reduction to quarterly once the multiplied results (10 minimum) are less than the highest reported chronic

toxicity for methanol laden produced water in two consecutive tests. If the permittee seeks frequency reduction through correlation, a specific characterization BMP Plan must be developed and submitted to DEC for review and comment that adequately addresses the objectives described in this paragraph. The BMP Plan may include components of the QAPP required per Section 4.1 so long as it is appropriately labeled in the BMP Plan.

4.2.9.6 Treatment Systems Standard Operating Procedures

The permittee must develop Standard Operating Procedures for the following three treatment systems:

4.2.9.6.1 Domestic Wastewater

For discharges of domestic wastewater, the permittee must develop and implement operation and maintenance SOPs per Section 2.2.3 that ensure consistent and effective removal of BOD₅ and TSS to minimum treatment standards per 18 AAC 72.050 as well as chlorination for bacteria destruction followed by dechlorination to achieve appropriate chlorine levels.

4.2.9.6.2 Domestic Graywater

For discharges of graywater treated using an MSD, or other system adding chlorine, the permittee must develop and implement operation and maintenance SOPs per Section 2.3.3 that ensure primary treatment for BOD₅ and TSS consistent with any waiver to minimum treatment issued by DEC and effective bacteria destruction using chlorine followed by dechlorination to achieve appropriate chlorine levels (e.g., less than 1.0 mg/L).

4.2.9.6.3 Produced Water

For discharges of produced water using separation followed by two-stage separation, the permittee must develop SOPs per Section 2.5.4 for the treatment system to ensure compliance with permit limits. The SOPs must include modes of operation (parallel versus series), operation and maintenance, troubleshooting, contingency modifications (added flotation to separation), prediction and monitoring of carbon exhaustion

4.2.9.7 BMPs for Cooling Water Intake Structures

This Permit incorporates 40 CFR Part 125, Subpart N the updated in 2014 and adopted by reference at 18 AAC 83.010(c)(9) for cooling water intake structures (CWIS) that requires new offshore oil and gas facilities to take measures to reduce entrainment and impingement of aquatic life associated with the construction and operation of CWIS. The CWIS regulation was promulgated to ensure that the location, design, construction, operation and capacity of CWIS reflect the best technology available to minimize adverse impacts to aquatic organisms.

The CWIS regulations apply to all facilities, new or existing, that are a point source discharge, intake 2 million gallons per day of water, and use at least 25 percent of that water for cooling. Per CWIS regulations, the owner or operator of a new offshore oil and gas extraction facility must comply with: (i) Track I in 40 CFR Part 125.134(b) or Track II in 40 CFR Part 125.134(c) if it is a fixed facility; or (ii) Track I in 40 CFR Part 125.134(b) if it is not a fixed facility (i.e., MODU).

This Permit requires the permittee to select and implement technologies or operational measures to minimize impingement mortality and entrainment of fish and shellfish and include this information in the BMP Plan. The BMP Plan requirement gives the permittee discretion on what methods to select and how to implement those methods. However, the Department retains the authority to impose more stringent conditions on a case-by-case basis, if such conditions are deemed necessary by the Department to comply with any provision of law in accordance with this Permit. Specifically, DEC can require the implementation of additional technologies and operational measures if there is potential for specified aquatic organisms to pass through the hydraulic zone of influence of the MODU cooling water intake structure.

APPENDIX C

Definitions

The following are common definitions of terms associated with APDES permits. Not all the terms listed may appear in a permit. Consult the footnote references for a complete list of terms and definitions.

Alaska Pollutant Discharge Elimination System (APDES) ^a	Means the state's program, approved by EPA under 33 U.S.C. 1342(b), for issuing, modifying, revoking and reissuing, terminating, monitoring and enforcing permits and imposing and enforcing pretreatment requirements under 33 U.S.C. 1317, 1328, 1342, and 1345
Annual	Means once per calendar year
Average	Means an arithmetic mean obtained by adding quantities and dividing the sum by the number of quantities
Average Monthly Limitation ^a	Means the highest allowable average of "daily discharges" over a calendar month calculated as the sum of all "daily discharges" measured during a calendar month divided by the number of "daily discharges" measured for that month.
Ballast Water	Means harbor or seawater added or removed to maintain the proper ballast floater level and ship draft or to preload legs of a jack-up rig to secure it to the seafloor.
Best Management Practices (BMPs) ^a	Means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage areas.
Bilge Water	Means water which collects in the lower internal parts of a drill rig or drilling vessel hull.
Biochemical Oxygen Demand (BOD) ^c	Means the amount, in milligrams per liter, of oxygen used in the biochemical oxidation of organic matter in five days at 20° C
Biocide	Means any chemical agent used for controlling the growth of or destroying nuisance organisms (e.g., bacteria, algae, and fungi).
Blowout Preventer Fluid	Means fluid used to actuate hydraulic equipment on the blowout preventer.
Boiler Blowdown	Means the discharge of water and minerals drained from boiler drums.
Bypass ^a	Means the intentional diversion of waste streams from any portion of a treatment facility
Categorical Sum	The term categorical sum refers to the summation of methodology MDLs that are unique within a suite of analytes, i.e. no duplications of methodologies.
Clean Water Act (CWA) ^a	Means the federal law codified at 33 U.S.C. 1251-1387, also referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972

Coastal	Means any location in or on a water of the United States landward of the inner boundary of the territorial seas.
Color ^b	Means the condition that results in the visual sensations of hue and intensity as measured after turbidity is removed
Commissioner ^a	Means the commissioner of the Alaska Department of Environmental Conservation or the commissioner's designee
Composite Samples	Composite samples must consist of at least eight equal volume grab samples at equal time intervals. A 24-hour composite sample means a combination of at least eight discrete samples of equal volume collected at equal time intervals over a 24-hour period at the same location. A "flow proportional composite" sample means a combination of at least eight discrete samples collected at equal time intervals over a 24-hour period with each sample volume proportioned according to the flow volume. The sample aliquots must be collected and stored in accordance with procedures prescribed in the most recent edition of Standard Methods for the Examination of Water and Wastewater.
Contact Recreation ^b	Means activities in which there is direct and intimate contact with water. Contact recreation includes swimming, diving, and water skiing. Contact recreation does not include wading.
Cooling Water	Means once-through noncontact cooling water or circulating noncontact cooling water that is discharge to accommodate make-up cooling water intake.
Criterion ^b	Means a set concentration or limit of a water quality parameter that, when not exceeded, will protect an organism, a population of organisms, a community of organisms, or a prescribed water use with a reasonable degree of safety. A criterion might be a narrative statement instead of a numerical concentration or limit.
Daily Discharge ^a	Means the discharge of a pollutant measured during a calendar day or any 24-hour period that reasonably and consistently (e.g., measured at approximately the same time each day) represents the calendar day for the purposes of sampling. For pollutants measured in units of mass, the "daily discharge" is calculated as the total mass of the pollutant discharged over the day. For pollutants with a limitation expressed in other units of measurement, the "daily discharge" is calculated as the average measurement of the pollutant over the day.
Deck Drainage	Means any waste resulting from platform washings, deck washings, spillage, rainwater, melt water, and runoff from curbs, gutters, and drains including drip pans and work areas within facilities subject to this permit.
Departmenta	Means the Alaska Department of Environmental Conservation
Desalination Waste	Means wastewater associated with the process of creating fresh water from seawater.
Development Facility	Means operations that are engaged in the drilling and completion of production wells. These operations may occur prior to or simultaneously with

	production operations.
Diesel Oil	Means the grade of distillate fuel oil, as specified in the American Society for Testing and Materials Standard Specification for Diesel Fuel Oils D975-91 that is typically used as the continuous phase in conventional oil-based drilling fluids. For the purpose of this permit, “diesel oil” includes the fuel oil present at the facility.
Design Flow ^a	Means the wastewater flow rate that the plant was designed to handle
Director ^a	Means the commissioner or the commissioner’s designee assigned to administer the APDES program or a portion of it, unless the context identifies an EPA director
Discharge ^a	When used without qualification, discharge means the discharge of a pollutant
Discharge of a Pollutant ^a	Means any addition of any pollutant or combination of pollutants to waters of the United States from any point source or to waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft that is being used as a means of transportation. Discharge includes any addition of pollutants into waters of the United States from surface runoff that is collected or channeled by humans; discharges through pipes, sewers, or other conveyances owned by a state, municipality, or other person that do not lead to a treatment works; discharges through pipes, sewers, or other conveyances leading into privately owned treatment works; and does not include an addition of pollutants by any indirect discharger.
Domestic Wastewater ^c	Means waterborne human wastes or graywater derived from dwellings, commercial buildings, institutions, or similar structures. "Domestic wastewater" includes the contents of individual removable containers used to collect and temporarily store human wastes.
Drill Cuttings	Means particles generated by drilling into subsurface geological formations and carried out from the wellbore with the drilling fluid. Examples of drill cuttings include small pieces of rock varying in size and texture from fine silt to gravel. Drill cuttings are generally generated from solids control equipment and settle out and accumulate in quiescent areas in the solids control equipment or other equipment processing drilling fluid.
Drilling Fluid	Means the circulating fluid (mud) used in the rotary drilling of wells to clean and condition the hole and to counterbalance formation pressure. The classes of drilling fluids are water-based fluid and non-aqueous drilling fluid.
Drilling Fluid System	For this Permit, drilling fluid system means a drilling fluid formulation designed specifically to perform for anticipated borehole conditions. If borehole conditions change that require a significant reformulation (e.g., switching from potassium/polymer to a lignosulfate fluid), it constitutes a new drilling fluid system. In contrast, the use of an additive does not constitute a new fluid system.
EC ₂₅	Means a point estimate of the toxicant concentration that would cause an observable adverse effect on a quantal, “all or nothing,” response (e.g., death, immobilization, or serious incapacitation) in 25 percent of the test organisms,

calculated by point estimation techniques.

Enhanced Mineral Oil	For the purposes of this permit, means a petroleum distillate which has been highly purified and is distinguished from diesel oil and conventional mineral oil in having a lower polycyclic aromatic hydrocarbon (PAH) content. Typically, conventional mineral oils have a PAH content on the order of 0.35 weight percent expressed as phenanthrene, whereas enhanced mineral oils typically have a PAH content of 0.001 or lower weight percent PAH expressed as phenanthrene.
Enhanced Mineral Oil Drilling Fluid	Means “drilling fluid” that has an enhanced mineral oil as its continuous phase with water as the dispersed phase.
Effluent ^b	Means the segment of a wastewater stream that follows the final step in a treatment process and precedes discharge of the wastewater stream to the receiving environment
Estimated	Means a way to estimate the discharge volume. Approvable estimations include, but are not limited to, the number of persons per day at the facility, volume of potable water produced per day, lift station run time, etc.
Exceedance	An exceedance is defined to occur whenever there may be an instantaneous concentration above the CCC or CMC
Excursion	An excursion is defined to occur only when the average concentration over the duration of the averaging period (i.e., four days or one hour) is above the CCC or CMC, respectively.
Excess Cement Slurry	Means the excess cement and wastes from equipment washdown after a cementing operation.
Excluded area	Means an area not authorized as a receiving water under a permit
Exploration Facility	For the purposes of this permit, means any fixed platform or mobile offshore drilling unit (MODU) that is engaged in the drilling of wells to determine the nature of potential hydrocarbon reservoirs. Any exploratory MODU that is not currently covered under AKG35100 – Mobile Oil and Gas Exploration Facilities in State Waters in Cook Inlet is a “new” mobile exploration facility.
Fecal Coliform Bacteria (FC) ^b	Bacteria that can ferment lactose at $44.5^{\circ} + 0.2^{\circ}\text{C}$ to produce gas in a multiple tube procedure. Fecal coliform bacteria also means all bacteria that produce blue colonies in a membrane filtration procedure within 24 ± 2 hours of incubation at $44.5^{\circ} + 0.2^{\circ}\text{C}$ in an M-FC broth.
Filter Backwash	Means wastewater generated when filters are cleaned and maintained.
Fire Control System Test Water	Means the water released during the training of personnel in fire protection and the testing and maintenance of fire protection equipment.
Fish ^b	Means any of the group of cold-blooded vertebrates that live in water and have permanent gills for breathing and fins for locomotion
Fixed Platform	A platform extending above and supported by the sea bed by means of piling,

	spread footings or other means with the intended purpose of remaining stationary over an extended period. For this Permit, Mobile offshore drilling units that are periodically used at or near a fixed platform for drilling activities including well plugging and abandonment is considered part of the fixed platform while conducting well drilling or abandonment activities.
Formation Oil	Means the oil from a producing formation which is detected in the drilling fluid, as determined by the GC/MS compliance assurance method, EPA Method 1655, when the drilling fluid is analyzed before being shipped offshore, and as determined by the RPE method, EPA Method 1670, when the drilling fluid is analyzed at the offshore point of discharge.
Garbage	Means all kinds of victual, domestic, and operational waste, excluding fresh fish and part thereof, generated during the normal operation and liable to be disposed of continuously or periodically except dishwater, graywater, and those substances that are defined or listed in other Annexes to MARPOL 73/78.
Geometric Mean	The geometric mean is the Nth root of the product of N. All sample results of zero will use a value of 1 for calculation of the geometric mean.
Geotechnical Drilling	For the purpose of this permit means a geotechnical survey that uses riser stem technology to circulate water-based drilled fluids to the water surface for reuse.
Geotechnical Facility	For the purposes of this permit means any floating, moored, or stationary vessel, jack-up or lift barge actively conducting geotechnical surveying in open water.
Geotechnical Survey	For the purpose of this permit means any subsurface investigation that collects sediment samples to assess the structural properties of subsurface soil condition for potential placement of structures such as oil and gas production and drilling platforms, gravel islands, anchor structures for floating exploration drilling vessels, ports and harbors, and potentially buried pipeline corridors
Grab Sample	Means a single instantaneous sample collected at a particular place and time that represents the composition of wastewater only at that time and place
Graywater ^c	Means wastewater from a laundry, kitchen, sink, shower, bath, or other domestic source that does not contain excrement, urine, or combined storm water
Horizontal Direction Drilling	Drilling for the purpose of installing an underground oil or gas transmission pipeline or conduit to an onshore protection facility using a rotary drill bit that can affect the direction of the drilling path near horizontal. Horizontal Directional Drilling (HDD) for this Permit may also include discharges associated with a jack-up rig or mobile offshore drilling unit attached to the seafloor for the purpose of pulling pipe through the HDD borehole but not conducting drilling activities.
Hydrostatic Test Water	For the purposes of this permit, means water that is used to hydrotest the integrity of pipelines, tanks, or equipment. Hydrostatic test water also includes incidental water of potable water or water purposefully flushed from

	potable systems.
IC ₂₅	Means a point estimate of the toxicant concentration that causes a 25 percent reduction (p) in a non-quantal biological measurement (e.g., reproduction or growth) calculated from a continuous model (the EPA Interpolation Method).
Influent	Means untreated wastewater before it enters the first treatment process of a wastewater treatment works
LC ₅₀	Means the concentration of effluent that is acutely toxic to 50 percent of the test organisms exposed.
Marine Sanitation Device	Means a sanitary wastewater treatment system specifically designed to meet U.S. Coast Guard requirements.
M9IM	Means those offshore facilities continuously manned by nine (9) or fewer persons or only intermittently manned by any number of persons.
M10	Means those offshore facilities continuously manned by ten (10) or more persons.
Maintenance Waste	Means materials collected while maintaining and operating the facility, including, but not limited to, soot, machinery deposits, scraped paint, deck sweepings, wiping wastes, and rags.
Maximum Daily Limitation ^a	Means the highest allowable “daily discharge”
Mean ^b	Means the average of values obtained over a specified period and, for fecal coliform analysis, is computed as a geometric mean
Measured	Means the actual volume of wastewater discharged using appropriate mechanical or electronic equipment to provide a totalized reading. Measure does not provide a recorded measurement of instantaneous rates.
Milligrams per Liter (mg/L) ^b	Means the concentration at which one thousandth of a gram (10 ⁻³ g) is found in a volume of one liter. It is approximately equal to the unit “parts per million (ppm),” formerly of common use.
Mineral Oil	Means a class of low volatility petroleum product, generally of lower aromatic hydrocarbon content and lower toxicity than diesel oil.
Mineral Oil Pills	Means a slug of mineral circulated in the drilling fluid system in attempt to free stuck pipe. Pills generally consist of two parts; a spotting compound (also called mineral oil spots).
Mixing Zone ^b	Means a volume of water adjacent to a discharge in which wastes discharged mix with the receiving water
Mobile Offshore Drilling Unit	Mobile Offshore Drilling Units (MODUs) are semi-submersibles, drilling vessels, jack-ups rigs, submersibles, ultradeepwater units, etc that are used in drilling operations. For this Permit, MODUs that are connected to or set near a fixed facility for exploration, development, production drilling, or well plugging and abandonment are considered part of the fixed facility while connected or while the MODU is secured to the seafloor near the fixed facility.
Month	Means the time period from the 1st of a calendar month through the last day

	in the month
Monthly Average	Means the average of daily discharges over a monitoring month calculated as the sum of all daily discharges measured during a monitoring month divided by the number of daily discharges measured during that month
Muds, Cuttings, Cement at seafloor	Means the materials discharged at the surface of the ocean floor in the early phases of drilling operations, before the well casing is set, and during well abandonment and plugging.
New Facility	Means a facility that has not operated in the area specified in the Notice of intent (NOI) prior to the submission of the NOI.
New Source	For the purposes of this permit, means any facility or activity that initiates the process of surveying, clearing or preparing an area of the water body floor for the purpose of constructing or placing a development or production facility on or over the site after New Source Performance Standards have been promulgated. For Offshore Subcategory facilities, New Source Performance Standards were promulgated on March 4, 1993 (see 58 FR 12454). For Coastal Subcategory facilities that date was December 16, 1996 (see 61 FR 66125).
Non-aqueous drilling fluid (NAF)	Means “drilling fluid” that has water-immiscible fluid as its continuous phase and the suspending medium for solids, such as oleaginous materials (e.g., mineral oil, enhanced mineral oil, paraffinic oil, C16-C18 internal olefins, and C8-C16 fatty acid/2-ethylhexyl
Offshore	Means offshore of the inner boundary of the territorial seas.
Oil-based Drilling Fluid	Means “drilling fluid” that has diesel oil, mineral oil, or some other oil, but neither a synthetic material nor enhanced mineral oil, as its continuous phase with water as the dispersed phase.
Open waters	Means ponds, lakes, streams, rivers, and marine waters not covered by ice.
PAH	Means polynuclear aromatic hydrocarbons.
Per Day	Means through a 24-hour period.
Permittee	Means a company, organization, association, entity, or person who is issued a wastewater permit and is responsible for ensuring compliance, monitoring, and reporting as required by the permit
pH ^g	Means a measure of the hydrogen ion concentration of water or wastewater; expressed as the negative log of the hydrogen ion concentration in mg/L. A pH of 7 is neutral. A pH less than 7 is acidic, and a pH greater than 7 is basic.
Primary Treatment ^c	Means wastewater treatment that: (a) will subsequently discharge wastewater to land or waters that are not waters of the United States and substantially removes all floating and settleable solids; or uses fine screens with 0.04-inch or smaller openings; or (b) will subsequently discharge wastewater to waters of the United States and uses screening, sedimentation, and skimming adequate to remove at least 30 percent of the biochemical oxygen demanding material and of the suspended solids in the treatment works influent; and disinfection, where appropriate.

Principal Executive Officer ^a	Means the chief executive officer of the agency or a senior executive officer having responsibility for the overall operations of a principal geographic unit of division of the agency
Pollutant ^a	Means dredged spoil, solid waste, incinerator residue, filter backwash, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials (except those regulated under 42 U.S.C. 2011), heat, wrecked or discarded equipment, rock, sand, cellar dirt, and industrial, municipal, or agricultural waste discharged into water
Practicable	Practicable means available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes.
Produced Water	Means fluid extracted from a hydrocarbon reserve during development or production. The fluids is generally a mixture of oil, water and natural gas. This may include formation water, injection water, and any chemicals added downhole or during the oil/water separation process.
Production Facility	For this Permit means any mobile or fixed structure, or other structure such as subsea completion components of onshore facilities, that is either engaged in well completion or used for active recovery of hydrocarbons from producing formations. It includes well plugging and abandonment activities and hydrocarbon fluids separation even if located separately from wellheads. These operations may occur simultaneously with or following development operations.
Receiving Waterbody	Means lakes, bays, sounds, ponds, impounding reservoirs, springs, wells, rivers, streams, creeks, estuaries, marshes, inlets, straits, passages, canals, the Pacific Ocean, Gulf of Alaska, Bering Sea, and Arctic Ocean, in the territorial limits of the state, and all other bodies of surface water, natural or artificial, public or private, inland or coastal, fresh or salt, which are wholly or partially in or bordering the state or under the jurisdiction of the state. (See “Waters of the U.S.” at 18 AAC 83.990(77))
Recommencing Facilities	Those facilities that may have let permit coverage lapse but still meet the coverage requirements of the Permit.
Report	In this Permit, the definition of report may include, but not be limited to, inputting results of analysis on a Discharge Monitoring Report, submit a document summarizing the results of a study or activity, or notify the Department of a triggering condition or Permit violation.
Residual Chlorine	Means chlorine remaining in water or wastewater at the end of a specified contact period as combined or free chlorine.
Responsible Corporate Officer ^a	Means a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function or any other person who performs similar policy or decision making functions for the corporation The Responsible Corporate Officer can also be the manager of one or more manufacturing, production, or operating facilities if the requirements of 18 AAC 83.385(a)(1)(B)(i)-(iii) are met.

Secondary Recreation ^b	Means activities in which incidental water use can occur. Secondary recreation includes boating, camping, hunting, hiking, wading, and recreational fishing. Secondary contact recreation does not include fish consumption.
Severe Property Damage ^a	Means substantial physical damage to property, damage to the treatment facilities which causes them to become inoperable, or substantial and permanent loss of natural resources which can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production.
Sheen ^b	Means an iridescent appearance on the water surface
Shellfish ^b	Means a species of crustacean, mollusk, or other aquatic invertebrate with a shell or shell-like exoskeleton in any stage of its life cycle
Sidetrack Well	Means a new hole drilled from a main well to a different bottom-hole location. Also referred to as Step-out Well.
Solids Control Equipment	Means shale shakers, centrifuges, mud cleaners, and other equipment used to separate drill cuttings and/or stock barite solids from drilling fluid recovered from the wellbore.
Static Sheen Test	Means the standard test procedures in appendix 1 to subpart A of 40 CFR part 435 that have been developed for this industrial subcategory for the purpose of demonstrating compliance with the requirement of no discharge of free oil. Also referred to as EPA Test Method 1617.
Stock Barite	Means the barite that was used to formulate a drilling fluid.
Stock Base Fluid	Means the base fluid that was used to formulate a drilling fluid.
Synthetic-based Drilling Fluid	Means “drilling fluid” that has a synthetic material or a combination of synthetic materials as its continuous phase with water as the dispersed phase. Per 40 CFR 122.21(a)(3), a method approved under 40 CFR 136 is sufficiently sensitive when:
Sufficiently Sensitive Methods	(A) The method minimum level (ML) is at or below the level of the applicable water quality criterion for the measured parameter, or (B) The method ML is above the applicable water quality criterion, but the amount of the pollutant or pollutant parameter in the discharge is high enough that the method detects and quantifies the level of the pollutant or pollutant parameter in the discharge, or (C) The method has the lowest ML of the analytical methods approved under 40 CFR 136 for the measured pollutant or pollutant parameter.
Synthetic Material	As applied to synthetic-based drilling fluid means material produced by the reaction of specific purified chemical feedstock, as opposed to the traditional base fluids such as diesel and mineral oil which are derived from crude oil solely through physical separation processes.
Territorial Seas	Means the belt of the seas measured from the line of ordinary low water along that portion of the coast which is in direct contact with the open sea and the line marking the off shore limit of inland waters, and extending off

	shore a distance of three miles.
Test Fluid	Means the discharge that would occur should hydrocarbons be located during exploratory drilling and tested for formation pressure and content. This would consist of fluids sent downhole during testing along with water from the formation.
Total Suspended Solids (TSS) ^g	Means a measure of the filterable solids present in a sample, as determined by the method specified in 40 CFR Part 136
Twice per year	Means two time periods during the calendar year: October through April and May through September.
Upset ^a	Means an exceptional incident in which there is unintentional and temporary noncompliance with technology-based effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.
Victual Waste	Means any spoiled or unspoiled food waste.
Wastewater Treatment	Means any process to which wastewater is subjected in order to remove or alter its objectionable constituents and make it suitable for subsequent use or acceptable for discharge to the environment
Water-based Drilling Fluid	Means “drilling fluid” that has water as its continuous phase and the suspending medium for solids, whether or not oil is present.
Water Depth	Means the depth of the water between the surface and the seafloor as measured at mean lower low water.
Waterflooding Discharges	Means discharges associated with the treatment of seawater prior to its injection into a hydrocarbon-bearing formation to improve the flow of hydrocarbons from production wells, and prior to its use in operating physical/chemical treatment units for sanitary waste. These discharges include strainer and filter backwash water.
Well Completion Fluids	Means salt solutions, weighted brines, polymers and various additives used to prevent damage to the well bore during operations which prepare the drilled well for hydrocarbon production. These fluids move into the formation and return to the surface as a slug with the produced water.
Workover Fluids	Means salt solutions, weighted brines, polymers, or other specialty additives used in a producing well to allow for maintenance, repair, or abandonment procedures. Drilling fluids used during workover operations are not considered workover fluids by definition. Packer fluids (low solid fluids between the packer, production string, and well casing) are considered to be workover fluids.
Waters of the United States or Waters of the U.S.	Has the meaning given in 18 AAC 83.990(77)

Water Recreation ^b	See contact recreation or secondary recreation
Water Supply ^b	Means any of the waters of the United States that are designated in 18 AAC 70 to be protected for fresh water or marine water uses. Water supply includes waters used for drinking, culinary, food processing, agricultural, aquacultural, seafood processing, and industrial purposes. Water supply does not necessarily mean that water in a waterbody that is protected as a supply for the uses listed in this paragraph is safe to drink in its natural state.
Week	Means the time period of Sunday through Saturday
4-day LC ₅₀	A as applied to the sediment toxicity means the concentration (milligrams/kilogram dry sediment) of the drilling fluid in sediment that is lethal to 50 percent of the <i>Leptocheirus plumulosus</i> test organisms exposed to that concentration of the drilling fluids after four days of constant exposure.
10-day LC ₅₀	As applied to the sediment toxicity means the concentration (milligrams/kilogram dry sediment) of the drilling fluid in sediment that is lethal to 50 percent of the <i>Leptocheirus plumulosus</i> test organisms exposed to that concentration of the drilling fluids after ten days of constant exposure.
96-hour LC ₅₀	Means the concentration (parts per million) or percent of the suspended particulate phase (SPP) from a sample that is lethal to 50 percent of the test organisms exposed to that concentration of the SPP after 96 hours of constant exposure.
C ₁₂ -C ₁₄ Ester and C ₈ Ester	Means the fatty acid/2-ethylhexyl esters with carbon chain lengths ranging from 8 to 16 and represented by the Chemical Abstracts Service (CAS) No. 135800-37-2.
C ₁₆ -C ₁₈ Internal Olefin	Means the fatty acid/2-ethylhexyl esters with carbon chain lengths ranging from 8 to 16 and represented by the Chemical Abstracts Service (CAS) No. 135800-37-2.
C ₁₆ -C ₁₈ Internal Olefin Drilling Fluid	Means a C ₁₆ -C ₁₈ internal olefin drilling fluid formulated as specified in Appendix 8 of subpart A of 40 CFR Part 435.
Quarterly	For this Permit, means January through March, April through June, July through August, and September through December.
