2024 Summer Season Air Quality Report for Big Lake, Alaska

The QuantAQ MODULAIR sensor in Big Lake (61.5477 ° N, 149.8197 ° W) was installed on 07/01/2024.

The sensor measures for carbon monoxide (CO), ozone (O₃), nitrogen oxide (NO), nitrogen dioxide (NO₂), particulate matter (PM_{2.5} and PM₁₀), temperature (°C), and relative humidity (RH). Data is collected every minute and is then processed into hourly averages.

The sensor in Big Lake has run well since its installation in July of 2024; there have been no physical issues with the sensor.

This data report covers the date range of July 1, 2024, to September 30, 2024.

Daily PM_{2.5} Air Quality Index (AQI) for July 1, 2024 - September 30, 2024

2024 Summer Season Air Quality Report for Big Lake

Median PM_{2.5} Concentrations for July 1, 2024 - September 30, 2024

Descriptive Statistics of Air Pollutants*

Parameter	1-hr PM _{2.5} (µg/m ³)	24-hr PM _{2.5} (µg/m ³)	1-hr PM ₁₀ (µg/m ³)	24-hr PM ₁₀ (µg/m ³)	1-hr O ₃ (ppb)	1-hr NO ₂ (ppb)	1-hr NO (ppb)	1-hr CO (ppb)
Min	0.20	0.60	2.00	0.60	-6.40***	1.91	1.42	271.03
Mean	2.79	2.78	18.54**	18.49**	14.81	12.21	2.14	340.69
1 st Max	38.10	7.20	912**	84**	87.20	22.78	16.99	1228.15
2 nd Max	33.50	7.20	705**	74**	84.60	22.55	16.33	992.84

Data Discussion

Big Lake's PM_{2.5} ambient air quality for the summer 2024 season fell mostly in the “good” range of the Air Quality Index (AQI; more information about AQI is provided on page 3). Several times from July through September, daily AQI reached into the “moderate” range for very brief (1-4 hours) periods of time before returning to “good” levels. Diurnal patterns show little variability of PM_{2.5} concentrations across different months, times of day, or days of the week.

*These statistics are based on preliminary data readings and are intended to provide a brief overview of sensor activity. Finalized data may be obtained upon request and through our annual statistical reports. Data from the community sensor network is non-regulatory and not comparable to the EPA's National Ambient Air Quality Standards (NAAQS; more information about the EPA NAAQS is provided on page 3).

**PM10 particle sensors are influenced by weather events such as fog and snow due to hygroscopic effects, creating false maximum values that do not pose health risks.

***Negative values can be attributed to expected uncertainty or sensor calibration drift. Values that fall within the expected uncertainty range are still considered 'good'. If the drift reaches a certain threshold, the sensor is recalibrated.
